Assignment :1

Q1) What is figma?

Ans figma is a cloud based UI/UX design tool used to design websites, mobile apps, and digital products.
One of its biggest features is realtime collaboration, where multiple designers can work on the same file together.
figma is used in modern UI/UX workflows because it combines design, prototyping, and collaboration, teams don't need multiple tools.

Q2) Differentiate between Designing and Prototyping in figma?

Ans)

Designing	Prototyping
a) focuses on creating the visual appearance of UI.	focuses on showing how the UI works when users interact.
b) Purpose is to decide colors, fonts, layout, icons and spacing	To simulate user flow, navigation and interaction.
c) Includes Buttons, text fields, images, icons, and overall layout.	Click actions, hover effects, transitions, and animations.
d) No real interaction.	Interactive
e) Eg:- Designing creates the login screen with Input fields and a login button.	Eg:- Prototyping connects the login button to the home screen

Q3) What are components and styles in figma?

A: Components are the reusable UI elements like buttons, navbars, & cards.
If the main component is updated, all instances update automatically. Styles defines reusable design properties like colors, and effects. In large projects, this avoids repetitive work and design mismatches. Components and styles make the design system clean, consistent and scalable.

Q4) Explain Auto-Layout in figma!

A: Auto layout automatically adjusts spacing, padding and alignment of elements. It works like a flexible container that responds when content changes. When text grows or shrinks, Auto-Layout resizes the frame automatically. This helps designs adapt to different screen sizes like mobile, tablet, and desktop. It reduces manual resizing and improves responsiveness.

[Button frame]

| Padding |

| [Text] |

| Auto Adjusts |

Q5) Describe the complete developer handoff process in figma

Ans) The developer handoff starts by sharing the figma file or link with developers. Developers can inspect designs using Dev Mode or Inspect panel. They can see spacing, colors, font sizes, and measurements directly.

Assets like icons and images can be exported in formats like PNG, SVG, or JPG.

figma also shows CSS, IOS, and Android code snippets automatically. Overall, figma make collaboration between designers and developers smooth and fast.
